Special about 12" armtubes

In the section *Mounting the bushes* in the instructions it is described how the position of the 20 mm (13/16 ") hole is found. For 12" armtubes the distance from the center of the hole to the center of the turntable patten should be **294.1 mm** (11 9/16").

Overhang of the stylus should be **13.3 mm** (17/32"). If the arm bush is mounted exactly at above distance from the center of the turntable platter, the stylus should be positioned just under the front edge of the black plane of the arm tube.

Please note that the combination of 12" **blue** armtubes and relatively heavy cartridges may require an additional large counterweight for balancing. This will increase the effective mass, and use of the 12" **red** armtube instead should be considered.

The sound image most likely will be the best, if the counterweights are adjusted with the center of gravity above the counterweight rod.
